INSTALLATION INSTRUCTIONS

Thru-Hull, Spares Kit
Paddlewheel & Valve Kit 33-218

Fits Models: B44V, B66V, B66VL, B744V, B744VL

Follow the precautions below for optimal product performance and to reduce the risk of property damage, personal injury, and/or death.

WARNING: The valve assembly must be in the housing to make a watertight seal. When the valve assembly is removed, the blanking plug cannot prevent water from seeping into the boat. Never leave the boat in the water UNATTENDED without the valve assembly in the housing and the paddlewheel insert or blanking plug secured.

WARNING: Always wear safety goggles and a dust mask when installing.

WARNING: O-rings must be intact and well lubricated to make a watertight seal.

WARNING: Always attach the safety wire to prevent the insert from backing out in the unlikely event that the cap nut and/or insert nut fails or is screwed on incorrectly.

CAUTION: Never use solvents. Cleaner, fuel, sealant, paint, and other products may contain solvents that can damage plastic parts, especially the transducer’s face.

IMPORTANT: Please read the instructions completely before proceeding with the installation. These instructions supersede any other instructions in your instrument manual if they differ.

Servicing

CAUTION: Be careful to avoid cross threading the cap nut.

1. O-rings must be intact and well lubricated to make a watertight seal. Lubricate the replacement O-rings with silicone lubricant or petroleum jelly (Vaseline®). Replace the two O-rings near the bottom of the blanking plug. Do not place them near the pull ring (see Figure 1).

2. Remove the safety wire and unscrew the cap nut. With the blanking plug ready in one hand, remove the paddlewheel insert and valve assembly as one unit by grasping the pull ring and pulling upward. Rapidly insert the blanking plug to minimize the flow of water into the boat. TEMPORARILY hold the plug in place with the safety wire (see Figures 2 and 3). This is NOT a watertight or secure seal! Do not leave the boat in the water unattended.

3. Separate the paddlewheel insert from the valve assembly by removing the safety ring and the retaining pin. Grasp the insert by the pull ring and pull slowly upward.
4. Check the new valve assembly to see that the flap valve moves freely and seats against the sleeve (see Figure 4). Discard the old valve assembly.

5. To service the paddlewheel insert, use the new paddlewheel shaft to push the old shaft out about 6mm (1/4”). With pliers, remove the old shaft (see Figure 5).

6. Remove any aquatic growth from the insert using a stiff brush or putty knife. Clean the surface with mild household detergent and a Scotch-Brite® scour pad. If fouling is severe, lightly wet sand it with fine grade wet/dry paper.

7. Place the new paddlewheel in the cavity with the flat side of the blade facing the same direction as the arrow on the top of the insert.

8. Tap the new shaft into place until the ends are flush with the insert.

9. Replace the two O-rings in the groves near the paddlewheel. Do not place them near the pull ring. Lubricate the O-rings with silicone lubricant or petroleum jelly (Vaseline®).

10. Slide the paddlewheel insert into the valve assembly. Seat it into place with a twisting motion until the keys fit into the notches. Secure the paddlewheel insert with the retaining pin and safety ring(s) (see Figures 2 and 3).

11. Reinstall the valve assembly by first removing the safety wire from the blanking plug. With the valve assembly/insert ready in one hand, remove the blanking plug. Slide the valve assembly into the multisensor housing with the arrow on the top pointing forward toward the bow. Be sure the cable fits into the cable channel and the key in the housing fits into the notch in the sleeve (see Figure 4). (A pushing twisting motion will locate the key.) Screw the cap nut in place. Be careful to avoid crossing threading the cap nut. Hand-tighten only. Do not over tighten.

12. Always attach the safety wire to prevent the insert from backing out in the unlikely event that the cap nut and/or insert nut fails or is screwed on incorrectly. Reattach the safety wire (see Figures 2 and 3).

**Antifouling Paint**

Surfaces exposed to salt water must be coated with antifouling paint. Use water-based antifouling paint only. Never use ketone-based paint, since ketones can attack many types of plastic possibly causing damage. Paint the following surfaces.

- Exposed areas of the housing including the transducer’s face
- Bore of the housing up 30mm (1-1/4”)
- Outside wall below lower O-ring of paddlewheel insert
- Paddlewheel cavity
- Paddlewheel
- Blanking plug below lower O-ring including exposed end
